DETAILED ACTION

Allowable Subject Matter

1. Claims 1-39 and 41-42 are allowed.
2. The following is an examiner's statement of reasons for allowance:

Applicant's invention is drawn to a method and system that enable an online Internet Service Provider to test an ISP registered subscriber telephone line to determine whether the line has optional services features (i.e., call forward busy/no answer and call waiting) enabled on the line during the period in which the subscriber telephone line is occupied (i.e., while the line is in-use).

Prior art of record failed to teach or fairly suggest a method and system that enable an online service provider to determine from an online service provider telephony server whether a registered subscriber telephone line has call forward busy service and/or voicemail service is enabled on the telephone line comprising: placing a first test call across a network to the telephone line; receiving first signaling data through the network in response to the first test call; evaluating the first signaling data to determine whether the first test call is inspiring a ringing condition; placing a second test call across the network conditioned on whether the first signaling data indicates that the first test call is determined to be inspiring a ringing condition, the second test call being placed while the first test call remains inspiring ringing; receiving second signaling data through the network in response to the second test call; evaluating the second signaling data to determine whether the second test call is inspiring a ringing condition; concluding whether a call forward busy service is enabled on the telephone line based on whether the second test call is determined to be inspiring a ringing condition.
